

10 - Searching & Sorting

For example:

Input	Result
5 6 5 4 3 8	3 4 5 6 8

Ex. No. : 10.1

Date:

Register No.:

Name:

Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

```
n=int(input())
l=input().split(" ")
for i in range (n):
    l[i]=int(l[i])
l.sort()
print(*l)
```

Input Format

The first line contains an integer, n , the size of the [list](#) a .
The second line contains n , space-separated integers $a[i]$.

Constraints

- $2 \leq n \leq 600$
- $1 \leq a[i] \leq 2 \times 10^6$.

Output Format

You must print the following three lines of output:

1. [List](#) is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted [list](#).
3. Last Element: lastElement, the *last* element in the sorted [list](#).

Sample Input 0

```
3
1 2 3
```

Sample Output 0

[List](#) is sorted in 0 swaps.

First Element: 1

Last Element: 3

For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

Ex. No. : 10.2

Name:

Bubble Sort

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

1. [List](#) is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted [list](#).
3. Last Element: lastElement, the *last* element in the sorted [list](#).

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1

Last Element: 6

```
a=int(input())
count=0
b=[int(x) for x in input().split()]
for j in range(a):
    for i in range(a-j-1):
        if(b[i]>b[i+1]):
            count+=1
            b[i],b[i+1]=b[i+1],b[i]
print("List is sorted in",count,"swaps.")
print("First Element:",b[0])
print("Last Element:",b[-1])
```

Input Format

The first line contains a single integer n , the length of A .
The second line contains n space-separated integers,A[i].

Output Format

Print peak numbers separated by space.

Sample Input

5
8 9 10 2 6

Sample Output

10 6

For example:

Input	Result
4 12 3 6 8	12 8

Ex. No. : 10.3

Name:

Peak Element

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element $a[i]$ is a peak element if

$A[i-1] \leq A[i] \geq A[i+1]$ for middle elements. $[0 < i < n-1]$

$A[i-1] \leq A[i]$ for last element $[i=n-1]$

$A[i] \geq A[i+1]$ for first element $[i=0]$

```
n=int(input())
l=input().split(" ")
l1=[]
for i in range(n):
    if(i>0 and i<n-1):
        if(int(l[i-1])<=int(l[i]) and int(l[i])>=int(l[i+1])):
            l1.append(int(l[i]))
    elif(i==0 and int(l[i])>=int(l[i+1])):
        l1.append(int(l[i]))
    elif(i==(n-1) and int(l[i])>=int(l[i-1])):
        l1.append(int(l[i]))
for i in l1:
    print(i,end=" ")
```

For example:

Input	Result
1 2 3 5 8 6	False
3 5 9 45 42 42	True

Ex. No. : 10.4

Name:

Binary Search

Write a Python program for binary search.

```
a = input()
b = [int(i) for i in a.split(',')]
b.sort()

m = int(input())
first = 0
last = len(b) - 1
flag = 0

while first <= last:
    mid = (first + last) // 2
    if b[mid] == m:
        flag = 1
        break
    elif b[mid] < m:
        first = mid + 1
    else:
        last = mid - 1

if flag:
    print("True")
else:
    print("False")
```

Input:

1 68 79 4 90 68 1 4 5

output:

1 2

4 2

5 1

68 2

79 1

90 1

For example:

Input	Result
4 3 5 3 4 5	3 2
	4 2
	5 2

Name:

Frequency of Elements

To find the frequency of numbers in a list and display in sorted order.

Constraints:

$1 \leq n$, $\text{arr}[i] \leq 100$

```
l=input().split(" ")
d={}
s=set()
for i in l:
    count=0
    if(i not in s):
        s.add(i)
        for j in l:
            if(i==j):
                count+=1
        d[int(i)]=count
l1=list(d.keys())
l1.sort()
for i in l1:
    print(i,d[i])
```
